AI SLOT MACHINE EXPERIMENT

Generative AI as a Prototyping Tool

Akatsuki | Team 09

STEP 1 – TOP 5 CANDIDATES

- **#01 - Top 5 ✓**

  Basic and efficient result. Has well defined sound, rolling spin, credit count, etc.
- **#19 – Top 5 ✓**

  It has a shop to spend the tokens gained, concise structure for pinning and tokens.
- **#41 – Top 5 ✓**

  Different approach on the background, making it more dynamic and clear to the user, features lack of efficiency
- **18# – Top 5 ✓**

  Decent sound and spinning wheel with good emoji, it has the announcer and haptic features.
- **#24 - Top 5 ✓**

  Has great structure of the information. it's the only one that implement past iterations with emoji

TAKEWAY

Same prompt, 50 runs.
(4 failed, 2 were identical.)
Quality spread was wide :
top candidates differed heavily in features, UX, and design approach.

STEP 2 – TOP 3 CANDIDATES

- **#01 - Top 3 ✓**
  Added the features as required but did not have any surprising addition. Makes this already weak candidate not shine.
- **#19 – Top 3 ✓**
  Most balanced overall. Sound, design and animations all work correctly but did not surprise. However, still has potential to improve.
- **#41 – Top 3 ✓**
  Cursor tracking particles and full-screen fireworks added to the already good design made this an instant candidate.

TAKEAWAY

We focused on the design: animations, full-screen effects, colors.

STEP 3 — SEMI FINAL

- **#41 - Top 2 ✓**

  -Same dramatic fireworks after each win, glowing orbs that following cursor movement.
  -Most visually impressive candidate,
  but animation is little bit laggy.

- **#19 - Top 2 ✓**

  -Balanced feature set with screen flash animations and cursor effect.
  -All features work correctly, nothing outstanding.

TAKEAWAY

Both added interesting cursor effects the prompt never asked for and
AI kept drifted for visual spectacle. We also added some more sound effects.

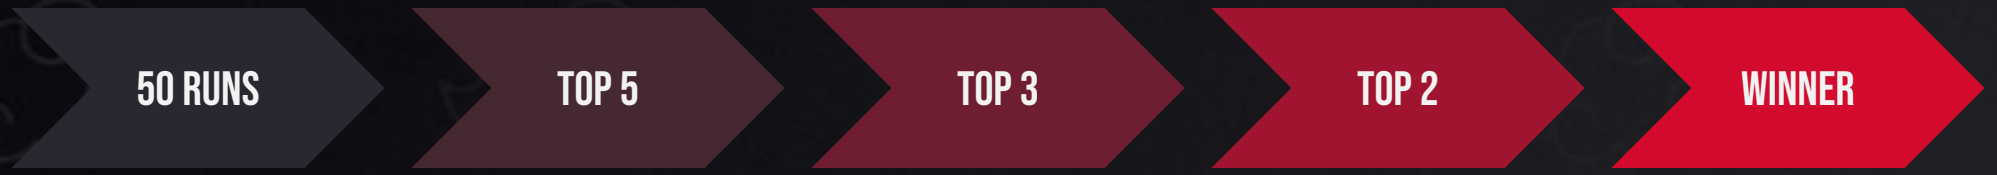
FINAL STEP - WINNER 🏆

- **#41 - Winner**
  - After the final refinement, it showed smoother orb animations and better audio feedback on both wins and losses.
  - Compared to #19, overall experience felt more engaging and rewarding, which made it our clear choice as the final candidate.

TAKEAWAY

As we tried repeated refinements with new prompts, the candidate improved to a point but then started becoming worse.

REFINEMENT PIPELINE



Each round : one refinement prompt (max 200 words), fresh session, no hand-editing.
50 baseline runs narrowed down to the best single candidate using Codex (GPT 5.2)

KEY CONCEPTS DISCOVERED

- Candidates 23, 26, 29, 31 have errors
- Two different iterations (1 and 21) results on the exact same layout with same effect, sound, features, etc
- Only two candidates have different UI, the rest have about the same theme
- Some of the candidates have basic features and other implement much more features like auto spin, coin store, past iterations, tax per roll, debt, etc
- In general, the majority of candidates work well but start accumulating bugs after multiple iterations

IMPORTANT METRICS

- Clear spinning animation
- Good spread of features that are functional
- Visuals look acceptable
- Audio feedback
- No basic bugs
